

Technical Assignment - Company Data Enrichment

Your task is to develop a programmatic workflow that can enrich the metadata associated with companies in a given dataset using publicly available information from the internet.

The attached input dataset is provided as a CSV file. Each row represents a company and contains the following attributes:

- Company Name (legal entity)
- City
- Address

Your workflow should use these input attributes to identify and enrich each company with the following information:

- Official company website
- What the business does
- Who its customers are

Please feel free to use any libraries, tools, APIs, or models you consider appropriate for the task.

Note that there may be websites belonging to companies with similar names or operating in similar businesses. Your workflow should take reasonable measures to ensure that the identified website and information correspond to the correct company.

Manual lookup of individual companies will not be considered an acceptable solution. The enrichment process should be programmatic and reproducible.

Please share your solution with **prateek@monter.one** in the following format:

- **Solution overview:** Briefly describe your approach, including how you validated the accuracy of the results.
- **Output CSV:** The original input CSV with the additional enriched attributes appended.
- **Source code:** Submit as a `.zip` or `.rar` file, along with a `README.md` containing instructions to reproduce the results.
- **AI tools usage statement:** Clearly mention any AI tools used (e.g., ChatGPT, Claude, etc.) and specify what they were used for (e.g., ideation, approach design, debugging, code generation, data cleaning, validation, etc.).
